

19' Decorative Windmill

This actual working windmill has a 6' diameter wheel. The beautiful redwood tower is both attractive and authentic looking. The redwood tower's base dimensions are 5' 6" x 5' 6" with an overall height to the top of the windmill blades of 19'

This windmill can be set up with a small stock tank, that is plumbed down to the bottom of a cylinder that will pump the water back up into the tank, for that authentic look of a real pumping windmill, without the need to drill a well below it. Later if you decide to drill a well, this same windmill will be able to pump down to approximately 100' from the surface.

Remember the soothing sound of the windmill running in the breeze. Those memories can be yours again with this fully functional windmill. This system is short enough to be able to use where height restrictions would be a problem, yet be a reminder of days gone past when times were slower and life was centered around the farm, the windmill, and the family.
